

8th Anti-Ageing Skin Care Conference  
29 - 30 November 2022  
Royal College of Physicians, London

Inflammaging in human photoexposed skin: Early onset of senescence  
and imbalanced epidermal homeostasis across the decades

John E. Oblong  
The Procter & Gamble Company  
Cincinnati, OH USA

# Skin Aging Continuum Model

**Aged phenotype**

**Prematurely Aged/Less healthy**

# Multi-Decade and Ethnicity Study (MDE)

## Objective:

Utilize a systems biology approach to develop a fundamental understanding of the molecular mechanisms which contribute to skin aging/photoaging

### Multiple Decades

20s, 30s, 40s, 50s, 60s,  
70s (n=22-25)

### Multiple Body Sites

Face, outer forearm,  
buttocks

### Systems Biology

Skin structure & biology,  
genomics, proteomics,  
metabonomics, epigenetics

*Dr. Alexa Kimball,  
Harvard U & Mass Gen*

# Laser Capture Microdissection (LCM)

Precise sampling of skin compartments and reduces complexity of signal with mixed compartments

Sebaceous glands

Hair Follicles

Epidermis

Dermis

# The Multi-Decade and Ethnicity Study (MDE)

Elastosis, inflammation, and erythema: Consistent pattern of highest levels in upper cheek

IL-1RA/IL-1 $\alpha$

410

188

33

20s

30s

40s

50s

60s

70s

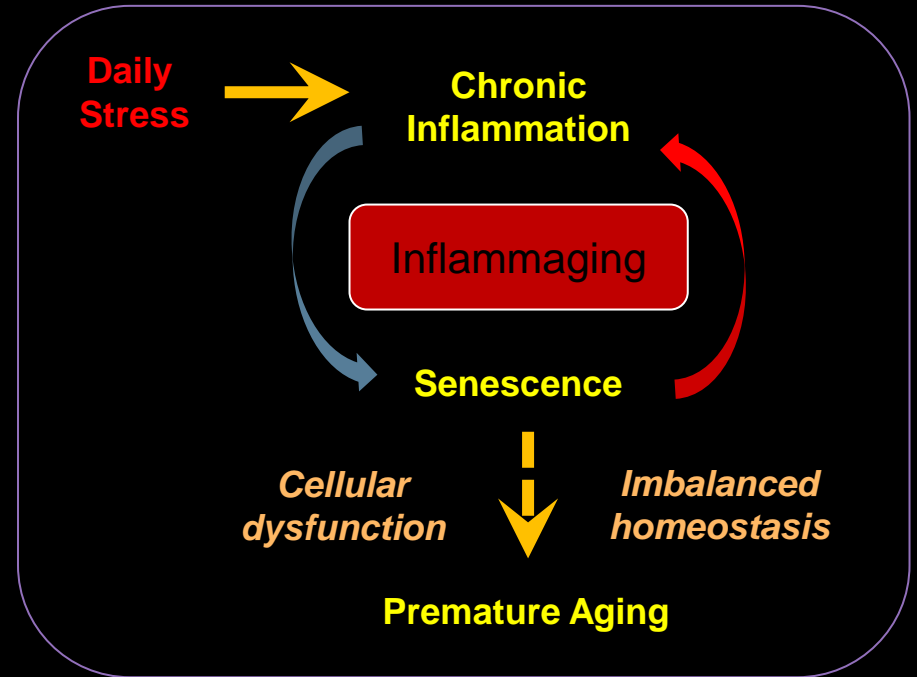

Macro structural elastosis increases with age

# The Multi-Decade and Ethnicity Study (MDE)

Hypothesis: Inflammaging ecosystem in skin

*Stress induced inflammation that leads to premature onset of senescence and aging*

# Markers of inflammation, photoexposure, and DNA damage and methylation elevated across age groups

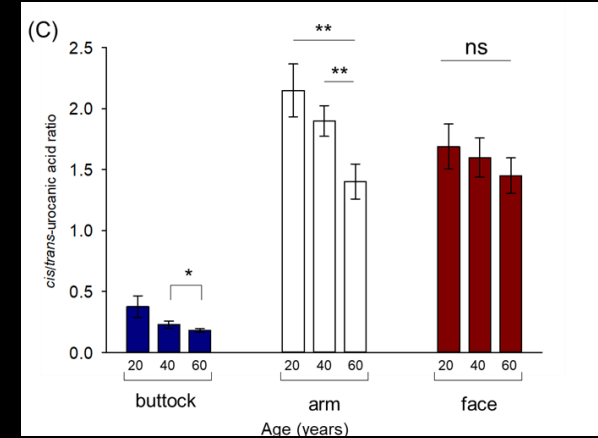

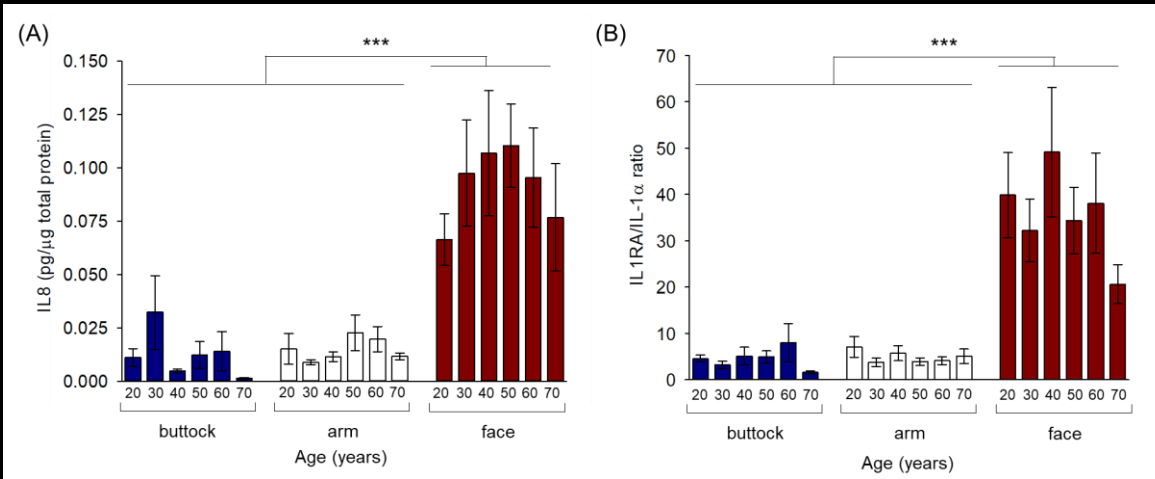

Inflammatory markers elevated in photoexposed face

Photosensitive biomarker elevated in both photoexposed sites

IL-8

IL1RA/IL-1 $\alpha$

*cis/trans*-urocanic acid

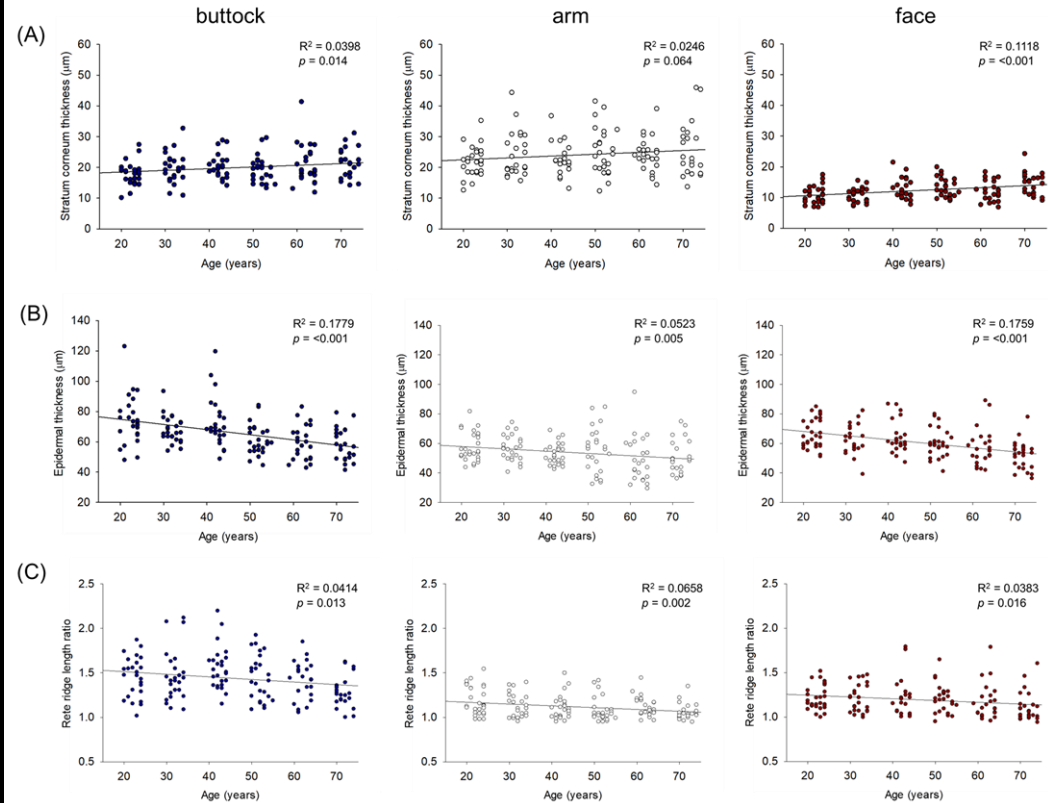

# Age-associated changes in epidermal morphology

young

old

Significant changes between 20's and 60-70's

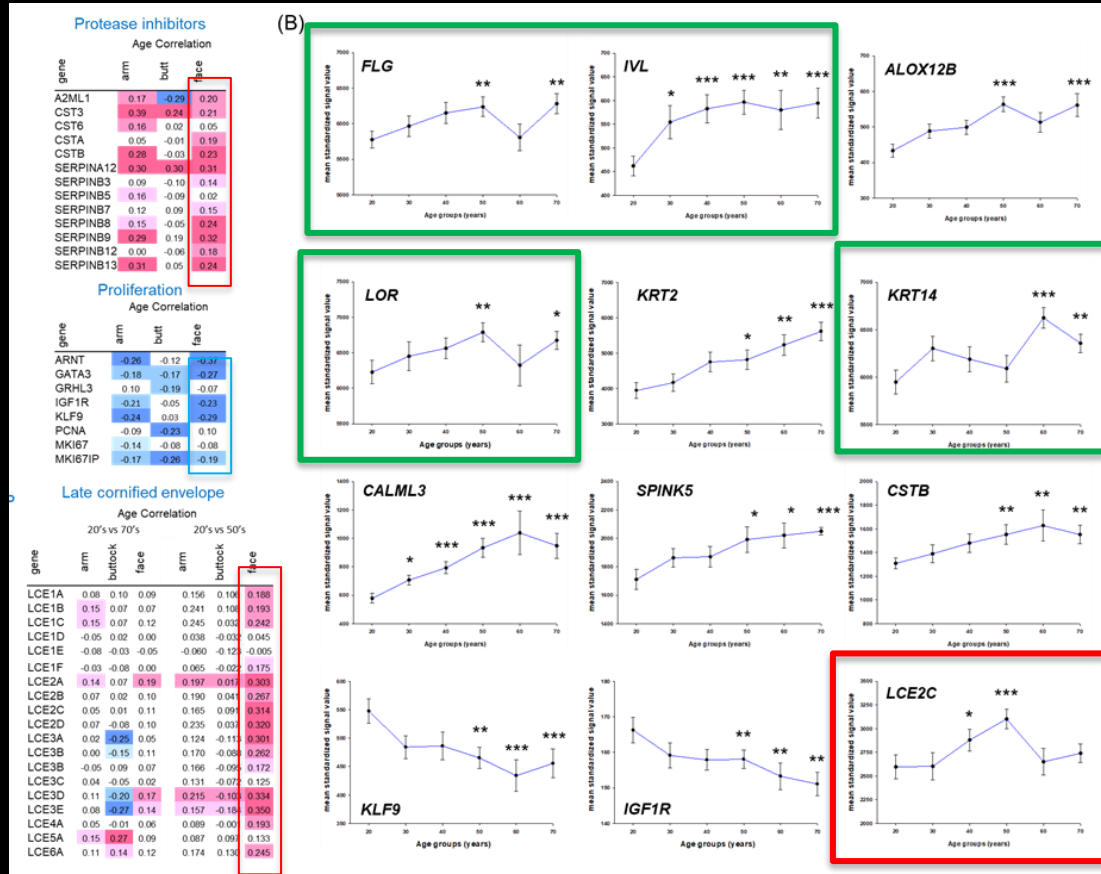

Loss of microcapillary vessels

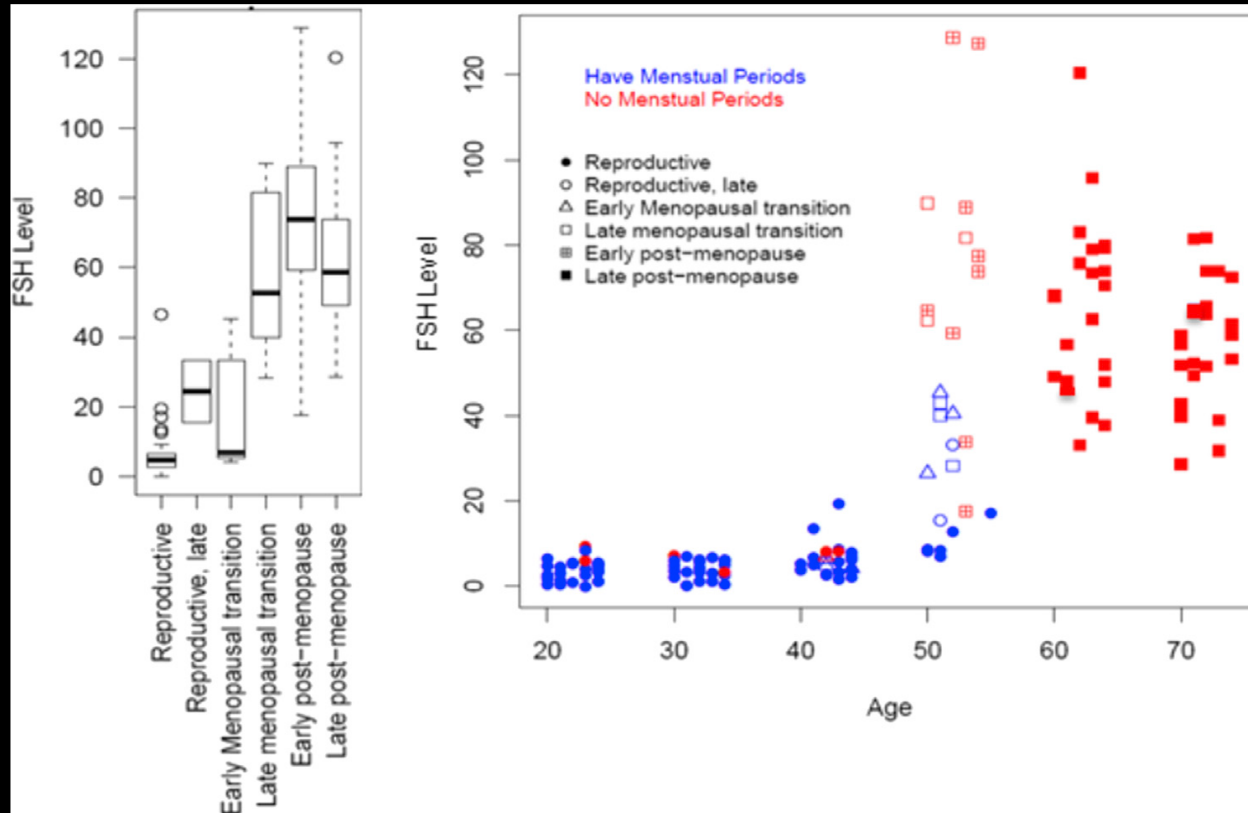

# Gene expression patterns of differentiation associated proteins

*Processes/components showing increased expression with photoage*

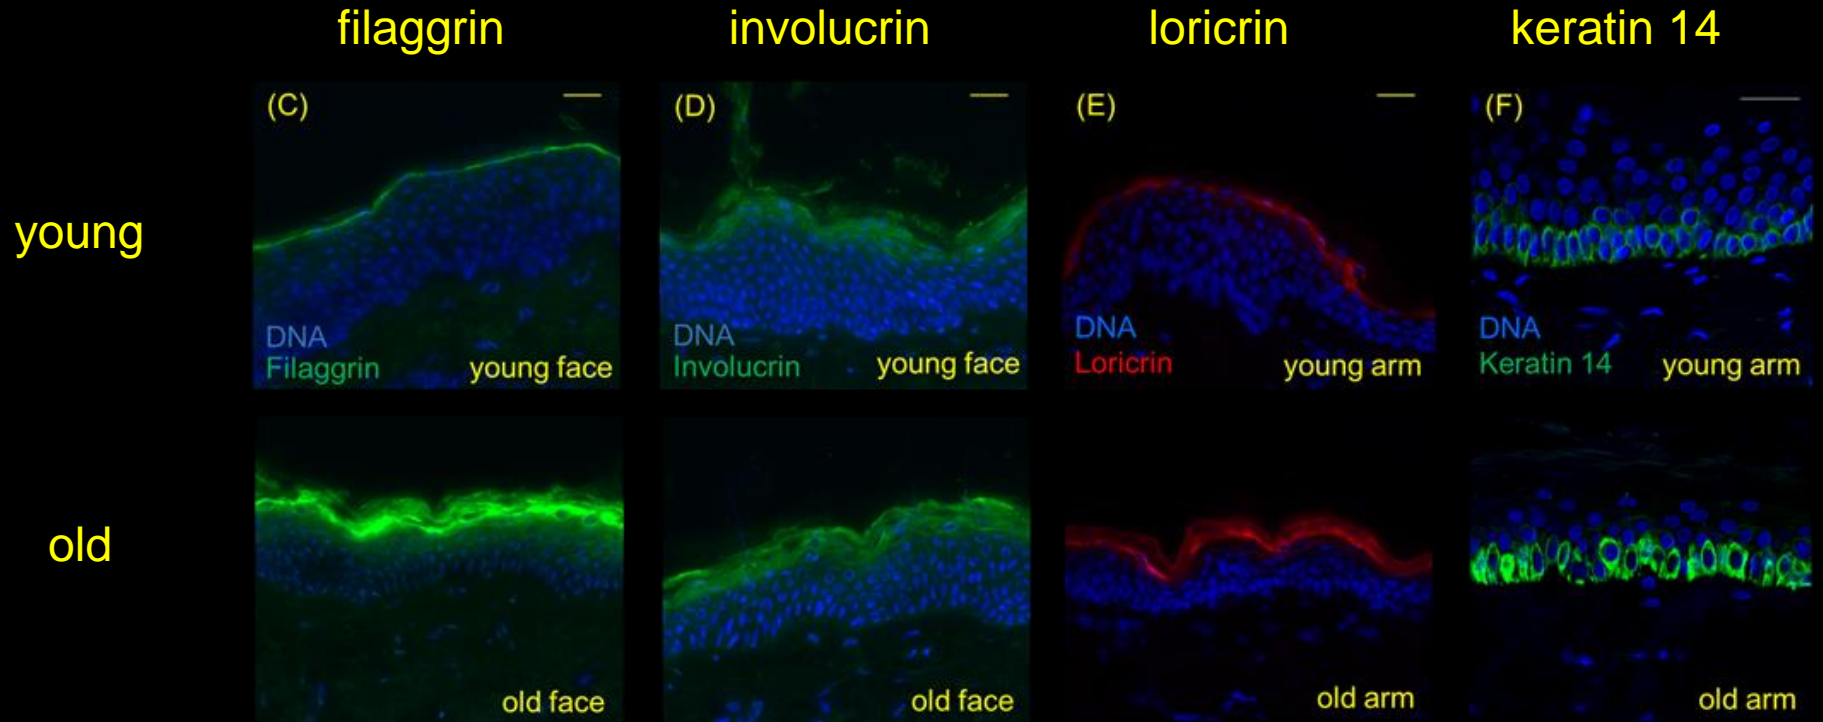

- Epidermal Differentiation Complex
- Proteases
- Keratins
- Calcium binding protein/AMP
- Protease inhibitors
- Proliferation (lower)
- Late cornified envelope (20's-50's)

# Menopausal status of MDE subjects

# Staining of select differentiation associated proteins in face and arms

# Proteomics supports similar directional differences as expression patterns between old and young (outer forearm)

Table 2. Median fold change of detected proteins between 60's and 20's age groups from laser capture microdissection sections of epidermis from photoexposed dorsal forearms and changes in gene expression correlation.

Protein	Gene	Median fold change 60's vs 20's	<i>p</i> -value	Gene expression changes with age
Keratin 2	KRT2	1.57	<0.001	Increased
Keratin 10	KRT10	1.50	<0.001	Increased
Cystatin M	CST6	1.86	0.001	Increased
Cystatin A	CSTA	2.37	0.002	Increased
Calpain 1	CAPN1	2.33	0.009	No
Fructose-bisphosphate aldolase A	ALDOA	2.04	0.010	Increased
Arachidonate 12 lipoyxgenase 12R	ALOX12B	2.42	0.011	Increased
Bleomycin hydrolase	BLMH	1.73	0.016	Increased
Annexin A8	ANXA8	1.86	0.020	Increased
Cystatin B	CSTB	2.14	0.022	Increased
Annexin A1	ANXA1	1.41	0.026	Increased
Involucrin	IVL	1.47	0.026	Increased
Transglutaminase 1	TGM1	1.38	0.026	Increased
Annexin A2	ANXA2	1.22	0.026	Decreased
Suprabasin	SBSN	1.37	0.026	Increased
Serine protease inhibitor Kazal-type 5	SPINK5	1.43	0.028	Increased
Calmodulin-like protein	CALML3	1.71	0.030	Increased
Malate dehydrogenase 2	MDH2	0.56	0.044	Decreased
Protein S100-A14	S100A14	1.35	0.046	Increased
Pyruvate kinase M	PKM	1.23	0.049	Increased
Gelsolin	GSN	1.23	0.062	Increased
Transglutaminase 3	TGM3	1.45	0.084	Increased
Hemoglobin alpha	HBA	16.40	0.092	Increased

Yale School of Medicine

# Markers of DNA damage

## 53BP1 – DDR marker

young

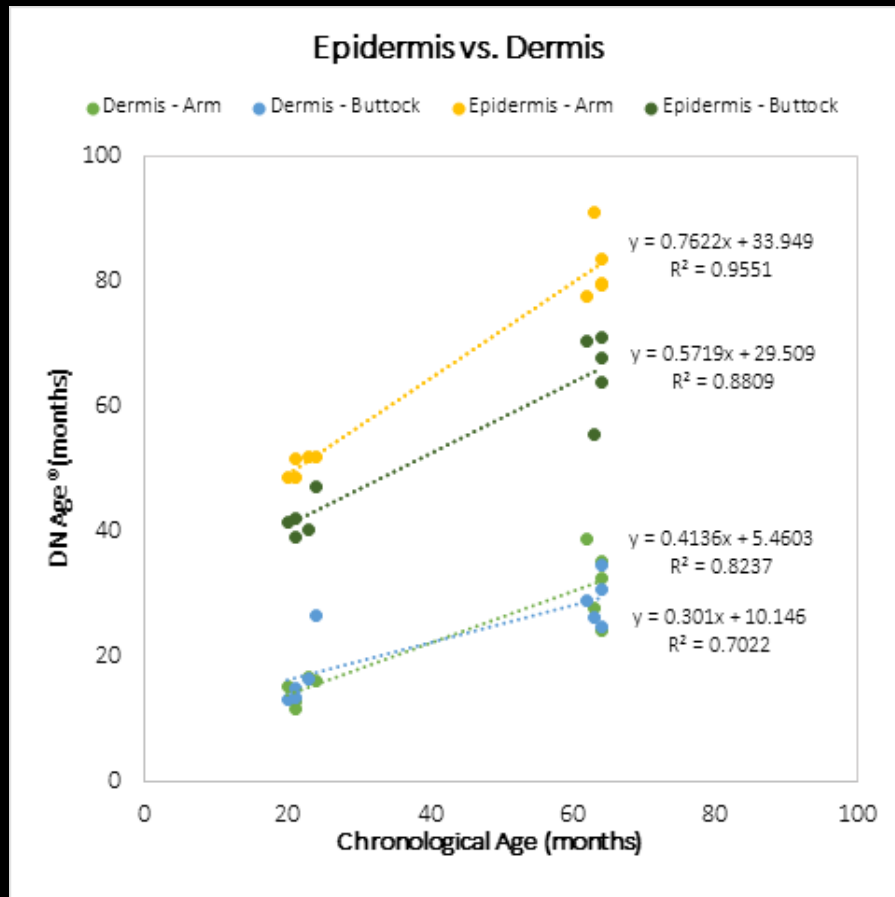

old

Higher in photoexposed arm compared to buttock sites and increases with age

# Markers of DNA methylation

## Epigenetic methylation content

- Epidermis - Higher in photoexposed arm compared to buttock sites and increases with age
- Dermis - Patterns increase with age but not photoexposure

# Senescence associated transcript profiles

## (B)

HIF-1 $\alpha$  and PFKFB3 Mediate a Tight Relationship Between Proinflammatory Activation and Anaerobic Metabolism in Atherosclerotic Macrophages  
 Ahmed Tawako, et al. Arteriosclerosis, Thrombosis, and Vascular Biology. 2015;35:1463–1471

# Greater staining for HIF-1 $\alpha$ and hemoglobin $\alpha$ in old photoexposed sites

## HIF-1 $\alpha$

# Keratinocytes shift towards glycolysis under lower oxygen tensions

- HaCaT keratinocytes grown under 5% or 20% O<sub>2</sub> conditions
- Mitochondrial function and glycolysis tested on Seahorse Flux Analyzer

## Mitochondrial energy stress test

## Glycolytic rates

# Impact of epidermal morphology changes on oxygen availability?

Normal barrier

Rete ridges  
(high surface area)

Intact blood capillaries  
(normal oxygen supply)

Age

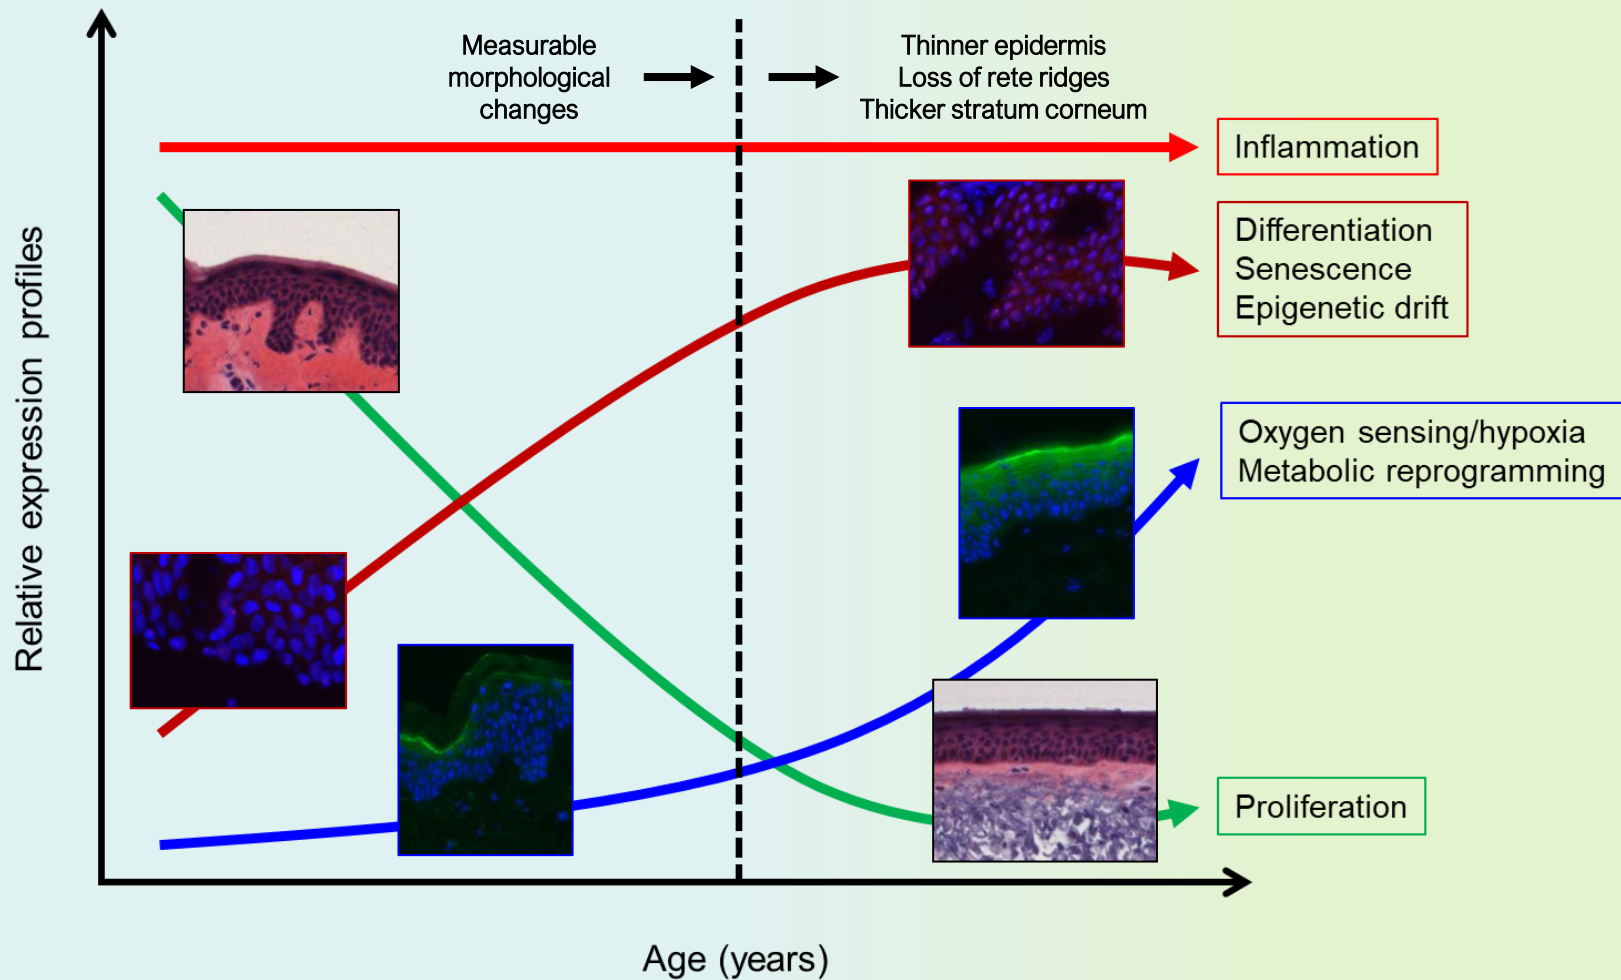

Thicker  
stratum corneum  
(longer path)

Loss of  
rete ridges  
(lower surface area)

Damaged leaky blood capillaries  
(lower oxygen supply)

# Key biological processes changing with age in epidermis of photoexposed skin

# Summary

- This systems biology-based analysis supports that photoexposed facial skin is undergoing inflammaging in the 20's and that multiple biologic pathways are affected in this process.
- Chronic presence of inflammation and senescence induction early in age may contribute to the molecular reprogramming, imbalance of epidermal homeostasis, and morphological changes.
- Heightened oxygen sensing/hypoxic response, epigenetic drift, and metabolic shift may play roles leading to this imbalance.
- Detection of non-erythroid-derived hemoglobin requires further evaluation on its function and role in skin biology and aging.
- While this work provides a body of evidence on the role of senescence and inflammaging in impacting skin aging, further work is still required.
